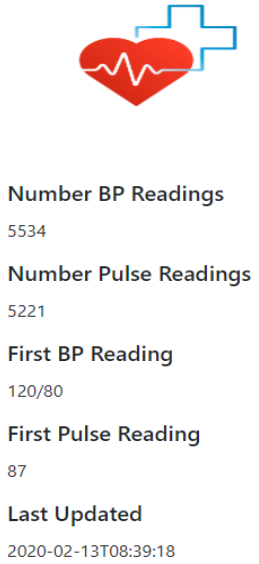
ACIT 3855 – Service Oriented Architectures – Winter 2026

Lesson 10 Pre-Reading

Reading – Dashboard UI and CORS

In Week 10, we will be adding a simple dashboard user interface to our system. This Dashboard UI will query some of the RESTful endpoints from our services. Here is what it might look like (for the sample application in class):



We are going to use a template for a simple Vanilla JS Single Page Application (SPA) to build this Dashboard UI. Using JavaScript, it will make RESTful API calls to our backend services:

- GET http://<Cloud VM DNS>:8100/stats (Processing Service)
- GET http://<Cloud VM DNS>:8110/<event>?index=<indev value> (Analyzer Service)
- GET http://<Cloud VM DNS>:8110/stats (Analyzer Service)

We will be running our Dashboard UI on http://<Cloud VM DNS>:80 or :3000 when deployed on the Cloud VM. So we are going to be violating the **Same Origin Policy** (SOP) – where a webpage cannot refer to other pages on different domains. We will be relaxing this for our test environment using a technique called **Cross Origin Resource Sharing** (CORS). Please read about SOP and CORS here:

- https://en.wikipedia.org/wiki/Same-origin_policy
- https://developer.mozilla.org/en-US/docs/Web/HTTP/Guides/CORS
